

TrustHome PH — Page List & Design Guide

Low-Fidelity → High-Fidelity, one shared reference for the whole team

Share this with every member before anyone opens Figma. The goal is **one consistent design system**, not five different interpretations of “verified” or “trust score.”

Platform note (confirmed with the team): TrustHome PH is a **responsive web app** built in React — not a native mobile app (that’s an explicitly labeled future phase). Renters and homeowners are the same account type (any user can browse, book, *and* list a property), so there’s one unified set of user-facing pages rather than two separate ones. Because almost all users will use it on a phone browser, every user-facing page is designed **mobile-portrait first**. Admins, however, will realistically use a laptop/desktop browser, so **every admin page is designed desktop-landscape**, with a sidebar layout instead of a single mobile column. This split is reflected in the page inventory below and in the breakpoint rules in Section B6.

Part 0 — Page Inventory

Every page below maps directly to a feature in the System Build Plan. Design each one, even the admin pages — panels do look at those.

User-facing — all mobile-portrait

Renters and homeowners are the same account type — every user can browse, book, *and* list a property, so there’s one merged set of pages instead of two separate ones.

#	Page	Purpose	Platform
1	Home / Landing	Hero + search bar, how TrustHome works, featured Verified listings, trust-building copy.	Mobile
2	Search & Browse Listings	Filterable results (city, price, type), sorted by Trust & Fairness score by default.	Mobile
3	Listing Detail	Photos, Verified badge, price, trust score breakdown, availability calendar, reviews, “Request Booking” CTA.	Mobile
4	Booking Request	Pick dates, see conflict check live, submit request.	Mobile
5	My Bookings	This user’s booking history (as the renter in that booking) — Pending / Confirmed / Completed / Disputed.	Mobile
6	Raise a Dispute	Form tied to a specific booking — reason + evidence description.	Mobile
7	Bank-Acquired Catalog	Filterable list of bank properties, each showing “Last verified” date.	Mobile
8	Bank Property Detail	Full details + embedded loan/amortization calculator.	Mobile
9	Saved Searches / Alerts	This user’s saved search filters, manage subscription.	Mobile
10	Login / Register	One simple signup flow — no role picker, since every account can both browse and list.	Mobile
11	Public Profile	Anyone’s trust score, rating, Verified badge, and dispute flag if any.	Mobile
12	My Dashboard	Overview of this user’s own listings and pending booking requests on them, quick	Mobile

		stats.	
13	Create / Edit Listing	Multi-step form — details, photos, ownership/ID document upload. Any signed-in user can post.	Mobile
14	My Listings	Status per listing this user has posted — Pending review / Verified / Rejected.	Mobile
15	Manage Booking Requests	Approve/reject incoming Pending requests on listings this user posted.	Mobile

Admin-facing — all desktop-landscape

#	Page	Purpose	Platform
16	Admin Dashboard	Pending listings count, open disputes count, recent activity.	Desktop
17	Listing Review Queue	View uploaded ID/ownership doc side-by-side with account name, Approve/Reject.	Desktop
18	Dispute Review Queue	Mark Founded / Dismissed, add resolution notes.	Desktop
19	User Management	View accounts, suspend/reinstate.	Desktop
20	Bank Catalog Status	Last scrape run per bank, manual “Run Scraper Now” trigger.	Desktop

Why admin is desktop-only: the SoftDev framework’s own guidance is to keep scope realistic — admins are a handful of trusted team members reviewing documents and tables, tasks that are genuinely easier on a bigger screen. Building a mobile-responsive admin panel too would be extra scope with no real user benefit right now.

PART A — LOW-FIDELITY WIREFRAMES

Goal: prove the layout and user flow work — nothing else. If a teammate is picking colors or a font at this stage, they’ve skipped ahead.

A1. What low-fidelity is for

- Confirming **where things go** on each page and **what happens** when a user clicks something — not what it looks like.
- Making it cheap to throw away and redo. If a wireframe took more than 15–20 minutes, it’s too detailed for this stage.
- Giving the whole team **one page structure to agree on** before anyone touches visual design, so nobody has to redo layout work later.

A2. Grayscale only — no color, ever

Using color at wireframe stage makes reviewers react to color choices instead of layout. Restrict every wireframe to these five values:

	#FFFFFF — page background
	#F2F2F2 — card / section background
	#D9D9D9 — borders, dividers, disabled elements
	#8C8C8C — placeholder image blocks, icons
	#333333 — all text, all buttons

A3. Typography — structure only, not style

Don’t pick a font yet. Use your wireframe tool’s default (Figma’s default is fine) and differentiate purely by **size and weight**, kept consistent across every teammate’s pages:

Element	Size	Weight
Page title (H1)	24px	Bold

Section heading (H2)	18px	Bold
Card title (H3)	15px	Bold
Body text	13px	Regular
Button label	13px	Bold
Caption / meta text	11px	Regular

A4. Layout grid

- **12-column grid**, 24px gutters, 24px outer margin on desktop; single column, 16px margins on mobile.
- Keep the **navigation bar and primary action button in the same position on every page** — this is one of the most common lo-fi mistakes and it's exactly what makes a wireframe review confusing.
- Design **mobile width first** (390px), even if the real product is desktop-first — it forces you to prioritize what actually matters on each page.

A5. How to draw each component (boxes only)

Component	How to represent it
Button	Rounded rectangle, bold label, no shadow
Input field	Rectangle outline + label placed <i>above</i> it (not inside, to avoid confusing it with a placeholder)
Image / photo	Gray box with a large X through it
Verified / status badge	Small pill shape with a text label ("VERIFIED", "PENDING", "DISPUTED") — no color-coding yet, label text is enough
Trust score	A number + 5 small boxes representing stars (filled vs. empty)
Card (e.g. listing card)	Rectangle border, image block on top, 2–3 lines of text below
Navigation bar	Full-width bar, logo placeholder left, 3–5 text links right

A6. Annotate everything

Every wireframe should have small numbered notes explaining **what happens on interaction** — e.g. "① *Tapping this card opens Listing Detail (Page 3)*". A wireframe with zero annotations is just a static picture, not a usable spec for whoever builds it next.

A7. Recommended tools

Figma (free tier, real-time multi-user editing — best choice since your whole team needs to work on the same file) or **draw.io** (free, simpler, good if the team wants to skip Figma's learning curve). Avoid pen-and-paper only, since it can't be shared cleanly with an AI tool or teammates working remotely.

A8. UX best practices to apply even at lo-fi stage

- **Match the platform's expected patterns.** A search bar goes at the top, not buried in a menu. A primary action (e.g. "Request Booking") should be the most visually prominent button on that screen, always.
- **Keep navigation identical across every page.** If the nav bar has 4 items on Home and 5 on Search, that's a real bug to catch now, not after high-fidelity design.
- **Design for the emptiest and fullest states, not just the ideal one.** What does Search Results look like with zero results? What does My Bookings look like for a brand-new user? Sketch both.
- **Every screen needs an obvious "next step."** If a user lands on a page and can't tell what to do next, the layout has failed regardless of how it looks visually later.
- **Content should be close to real length**, not "Lorem Ipsum" — write an actual short property title and price so the layout doesn't break once real data is added later.

A9. Low-fidelity checklist before moving to Part B

- ☐ All 20 pages have a wireframe, including admin pages.
- ☐ Every clickable element has an annotation explaining where it leads.
- ☐ Navigation placement is identical across every page.
- ☐ No color has been used anywhere except the 5 grays above.
- ☐ Empty-state and loaded-state are both shown for any page with a list (Search Results, My Bookings, Listing Review Queue).
- ☐ The whole team has reviewed and approved the flow *before* anyone starts high-fidelity design.

PART B — HIGH-FIDELITY DESIGN SYSTEM

Only start this once Part A is approved by the whole team. This section is deliberately specific — the goal is that any member (or an AI design tool) produces the *same* visual result from these values, not five different shades of blue.

B1. Typography

Primary typeface: **Inter** (free, Google Fonts, excellent readability at small sizes — important for data-dense admin screens). Fallback stack: `Inter, system-ui, "Segoe UI", sans-serif`.

Element	Size	Weight	Line height
H1 — Page title	32px	Bold (700)	1.2
H2 — Section heading	24px	Bold (700)	1.25
H3 — Card / subsection title	20px	Semibold (600)	1.3
H4 — Small heading / label	16px	Semibold (600)	1.4
Body text	14px	Regular (400)	1.5
Small / caption text	12px	Regular (400)	1.4
Button label	14px	Medium (500)	1

B2. Color Palette

Rationale: blue reads as trustworthy and professional (common in fintech and real-estate platforms for that reason); green is reserved *specifically* for “Verified,” so it carries real meaning wherever it appears instead of being decorative.

Swatch	Name	Hex	Use for
	Primary	#2563EB	Primary buttons, links, active nav state
	Primary Dark	#1E40AF	Button hover/pressed state
	Primary Light	#DBEAFE	Selected filters, subtle highlights
	Success / Verified	#16A34A	Verified badge, Confirmed/Completed status
	Warning / Pending	#D97706	Pending review, Pending booking status
	Danger / Disputed	#DC2626	Disputed status, Rejected, destructive actions
	Neutral 900	#111827	Primary text
	Neutral 600	#4B5563	Secondary text, captions
	Neutral 200	#E5E7EB	Borders, dividers
	Neutral 50	#F9FAFB	Page background
	White	#FFFFFF	Card background

Rule: green/amber/red are *only* ever used for status meaning (Verified/Pending/Disputed) — never as a decorative accent color elsewhere. This keeps the color system meaningful instead of arbitrary, and it’s the kind of consistency a panel notices.

B3. Spacing Scale

Use multiples of **4px** everywhere — never an arbitrary value like 13px or 22px:

4px · 8px · 12px · 16px · 24px · 32px · 48px · 64px

Example: card internal padding = 16px, spacing between cards = 24px, section spacing = 48px.

B4. Corner Radius

Element	Radius
Buttons, cards	8px
Input fields	6px
Badges / pills	999px (fully rounded)
Modals	12px

B5. Component Guidelines

- **Buttons:** Primary (filled, Primary Blue, white text), Secondary (white background, blue border and text), Danger (filled Danger Red, used only for destructive actions like “Suspend Account”). Every button needs a visible **hover**, **active/pressed**, and **disabled** state — don’t design only the default state.
- **Status badges:** always pair color *and* text label together (“● Verified”, “● Pending”, “● Disputed”) — never rely

on color alone (this is also an accessibility requirement, see B7).

- **Cards (listings):** white background, 8px radius, subtle shadow (`0 1px 3px rgba(0,0,0,0.1)`), image on top at a consistent aspect ratio (4:3 recommended for property photos).
- **Forms:** label above the field (not placeholder-only — placeholder text disappears once typing starts, which hurts usability), visible focus state (2px Primary Blue outline), inline error text in Danger Red directly below the field, not just a top-of-form summary.
- **Trust score display:** show the numeric score *and* a short plain-language cue next to it (e.g. “4.6 · Highly rated”) — a bare number means nothing to a first-time visitor.
- **Icons:** pick one icon set and use it everywhere — **Lucide** (free, consistent line-style, works well paired with Inter) is a solid default. Never mix icon styles (e.g. filled icons next to line icons) on the same screen.

B6. Responsive Breakpoints

Breakpoint	Width
Mobile	up to 599px
Tablet	600–1023px
Desktop	1024px and up

How this applies given our platform split (Part 0): user-facing pages should be designed and tested primarily at the **Mobile** breakpoint (390px is a good default canvas — matches a typical phone) since that’s genuinely how almost everyone will use the app. Admin pages should be designed at the **Desktop** breakpoint (1280px+ canvas is reasonable) with a persistent sidebar, since admin work happens on a laptop. Neither side needs to fully support every breakpoint in between for this project’s scope — pick your primary target per Part 0 and build to that; graceful degradation at other sizes is a nice-to-have, not a requirement, given the 1-month timeline.

Stack note: since the app is built in **React**, both the mobile-portrait and desktop-landscape layouts live in the same codebase — this is just CSS/layout logic reacting to screen width (or simply two different route trees if you’d rather keep the admin panel visually and structurally separate). Either approach is fine; don’t over-engineer a single “universal” layout component that tries to handle both — the sidebar-vs-bottom-nav difference alone makes that more trouble than it’s worth.

B7. Accessibility — non-negotiable, not a “nice to have”

- Text/background contrast must meet **WCAG AA** — minimum 4.5:1 for body text, 3:1 for large text (18px+ bold or 24px+ regular). The palette above was chosen to pass this against white/Neutral-50 backgrounds.
- Never use color as the *only* way to convey status — always pair it with a text label or icon (see B5).
- Interactive elements need a visible focus outline for keyboard navigation — don’t disable the browser’s default focus ring unless you replace it with an equally visible one.
- Minimum tappable size for buttons/links on mobile: 44×44px.
- Every uploaded photo needs alt text describing the property, not just a filename.

B8. General UI/UX Best Practices (applies to every high-fidelity screen)

- **Consistency over creativity.** The same action (e.g. “Approve”) should look and sit in the same place on every review screen — admin review queue and dispute review queue should feel like the same product, not two different tools.
- **Visual hierarchy guides the eye to the primary action first.** On Listing Detail, “Request Booking” should be the most visually dominant element on the page — bigger, higher contrast, than any secondary link.
- **Give feedback for every action.** A button click should show a loading state before success/error — never leave the user wondering if anything happened, especially for actions like submitting a dispute or uploading a document.
- **Prevent errors before they happen.** Disable the “Request Booking” button and show *why* if dates aren’t selected yet, rather than letting the user submit and then showing an error.
- **Progressive disclosure for complex forms.** The “Create Listing” flow (details → photos → document upload) should be broken into clear steps with a progress indicator, not one long overwhelming form.
- **Don’t make trust invisible.** Since the entire value proposition is “verified and trustworthy,” the Verified badge and trust score should be visible within the first glance at any listing card — not buried after a scroll.

PART C — USING THIS WITH AN AI DESIGN TOOL

When prompting an AI tool (v0, Galileo, Figma AI, or even asking an LLM to generate HTML/CSS or React components) for any of the 20 pages above, include these four things every time so output stays consistent:

1. **Which page** from the Part 0 inventory, and its one-line purpose.
2. **Fidelity level** — say explicitly “low-fidelity grayscale wireframe” or “high-fidelity using the design system below.”
3. **Paste the relevant spec** — for low-fi: Section A2–A5. For high-fi: Section B1–B6 (font, colors, spacing, radius).
4. **Name the key UX requirement** for that specific page (e.g. for Listing Detail: “*the Verified badge and trust score must be visible without scrolling*”).

Example prompt template:

Design the **[Listing Detail]** page for TrustHome PH — a verified rental marketplace. This is a **[high-fidelity]** screen. Use this design system: font — Inter, H1 32px/700, body 14px/400. Colors — primary #2563EB, success/verified #16A34A, neutral text #111827, background #F9FAFB. Spacing in multiples of 4px. 8px corner radius on cards and buttons. Key requirement: the Verified badge and trust score must be visible above the fold, and “Request Booking” must be the single most visually dominant element on the page. Follow WCAG AA contrast and give every button a hover, active, and disabled state.

Keep this exact template (swap only the page name, fidelity level, and key requirement) so every member’s AI-generated output stays visually consistent with everyone else’s.
